SUMMARY

CS graduate from Western University (2026) with production experience building backend services, full stack web apps, mobile apps, and AI-integrated pipelines — all shipped and running independently. Built PokeDropz, a real-time e-commerce monitoring platform on AWS serving 7,000+ active Discord users with 12+ months of continuous production operation. Shipped Morph, a native iOS app with a multi-step OpenAI pipeline pending App Store approval. Published GPT Mini, a Chrome extension integrating the OpenAI API. Proficient in Python, Java, JavaScript, TypeScript, Swift, C++, and C# — with hands-on experience in REST API design, async event-driven systems, cloud infrastructure, OOP & design patterns, unit testing, CI/CD, and AI-assisted development using Claude Code and Cursor.

EDUCATION

Western University — BSc Honours, Computer Science · Graduated June 2026 · London, Ontario

Coursework: Java OOP & Design Patterns, C/C++, C#, Data Structures & Algorithms, Databases I (SQL), Distributed Systems, Software Engineering, Operating Systems, AI I, Computer Organization, Statistics for Science

TECHNICAL SKILLS

Languages: Python, Java, JavaScript, TypeScript, Swift, C++, C#, Go

Mobile: Swift, SwiftUI, iOS SDK, XCode, XCTest, MVVM Architecture, Kotlin/Android concepts, React Native concepts, App Store submission process

Frontend & Web: React, HTML/CSS, TypeScript, JavaScript (ES6+), Chrome Extension API (MV3), Vue 3 concepts, Next.js concepts, Tailwind CSS, WebSockets, Socket.IO

Backend & APIs: Node.js, Spring Boot, REST API Design & Integration, FastAPI/Flask, Async & Event-Driven Architecture, Microservices, SQL (PostgreSQL, MySQL/MariaDB), Redis concepts, NoSQL concepts, Kafka concepts

AI & Agentic Systems: OpenAI API (Chat Completions, Vision), LLM Integration, Prompt Engineering, Prompt Chaining, Structured Model Outputs, Agentic Workflow Design, MCP (Model Context Protocol), LangChain concepts, RAG concepts, Claude Code, Cursor, GitHub Copilot, ChatGPT

Cloud & DevOps: AWS (EC2, S3), GCP, Azure concepts, Docker, Kubernetes concepts, Git & GitHub, CI/CD Pipelines, Linux/Unix, Production Monitoring & Observability, Logging & Alerting, Agile / Scrum

Practices: OOP & Design Patterns, SOLID Principles, Clean Architecture, TDD concepts, Unit & Integration Testing, Code Reviews, Debugging & Root Cause Analysis, Incident Response, Technical Documentation

PROJECTS

PokeDropz — Inventory Monitoring & Alert Platform · Python · Java · AWS EC2 & S3 · REST APIs · Async Pipeline · Event-Driven · Discord API

- Python backend on AWS EC2 monitoring hundreds of e-commerce SKUs in real time via rotating proxy pool — parses stock status changes and pushes instant alerts to 7,000+ users via Discord webhooks; S3 stores persistent state across restarts.
- Async pipeline with per-request retry logic and exponential backoff; Discord bot layer handles command parsing, role-based notification preferences, and channel routing for 7,000+ users.
- 12+ months in production on Linux — triaged failures, refactored caching to eliminate false-positive alerts, maintained documentation, and shipped continuous improvements with zero manual intervention.
- Used Claude Code and Cursor throughout development; applied full engineering judgment over all AI-assisted output before shipping.

Morph: AI Physique Coach (iOS) · Swift · SwiftUI · XCode · OpenAI Vision API · Chat Completions · Prompt Chaining · Structured JSON · MVVM

- Native iOS app in Swift and SwiftUI that passes a physique photo through OpenAI's Vision API for image analysis, then runs a multi-step prompt chain across Chat Completions to generate a rating, critique, personalized meal plan, and workout program.
- JSON schema constraints enforced at every pipeline stage ensure clean data contracts between model calls and eliminate parsing failures; MVVM architecture decouples UI from the AI pipeline — each layer independently testable and swappable.
- Completed full App Store submission process including build, TestFlight, and App Review submission; pending Apple approval.

GPT Mini — Chrome Extension · JavaScript · TypeScript · Chrome MV3 · OpenAI Chat Completions API · REST Integration

- Published Chrome extension that intercepts selected webpage text, sends it to the OpenAI Chat Completions API with an optional user prompt, and renders the AI response inline on the page — no new tab, no page reload, zero layout disruption to the host page.
- MV3 architecture: background service worker manages API calls and message passing; TypeScript content script handles all DOM manipulation, response rendering, and contextual UI anchoring with clean separation of concerns throughout.
